

Lipotropic-PLUS Injections

Boosts Weight Loss, Energy, and MORE!

Lipotropic injections offer an excellent tool to aid in weight loss while also improving energy. The unique **combination of B vitamins and amino acids** improve liver detoxification, break down and release stored fat, and enhance metabolism. They also can improve mood and mental clarity, liver and gallbladder function, as well as aid in the preservation of lean body tissue (muscle) and enhance the absorption of essential nutrients.

Lipotropic formulations include these essential B vitamins and amino acids:

L-Carnitine – An amino acid required for the transport and breakdown of body fat for the generation of metabolic energy. When administered by injection, nutrients like L-carnitine can be completely absorbed by the body.

Niacinamide (Vitamin B₃) – Assists in the catabolism of fats, carbohydrates, and proteins, as well as the sending of signals for DNA repair. Vitamin B₃ helps to modulate anabolic reactions such as synthesis of cholesterol and fatty acids. It is also thought to increase the basal metabolic rate.

Pyridoxine (Vitamin B₆) – Helps convert stored carbohydrates and other nutrients to glucose to maintain normal blood sugar levels and reduce cravings. Vitamin B₆ can help with weight loss by having a stimulating effect on the thyroid. This can be especially helpful for hormone balance in women when water retention is an issue. It also helps maintain the health of the immune system.

Thiamine (Vitamin B₁) – Helps convert carbohydrates into energy. This helps with workouts and helps all cellular processes speed up to an efficient level. Vitamin B₁ also helps with mental acuity.

Hydroxocobalamin (Vitamin B₁₂) – Helps with the conversion of food into energy, which makes it a great metabolic booster. B₁₂ works by helping with the breakdown of fatty acids in the body, which helps with energy production. It also helps improve digestion and protein synthesis, which aid in muscle growth.

Lipotropic-PLUS offers the benefits of these additional fat-busting agents:

Methionine – Acts as a lipotropic agent to assist in the breakdown of fats within the liver. Methionine helps to lower cholesterol, thereby preventing excess fat buildup in the liver and circulatory system. It also is helpful in preventing and relieving fatigue.

Inositol - Promotes the health of cell structures and nerve synapses. It aids in the metabolism of fats, helps reduce cholesterol, and participates in the action of serotonin, a neurotransmitter known to control mood and appetite.

Choline - Supports the liver in its processing and excretion of chemical waste products.

Administration: Gluteal Injection

Dosing: Weekly or semi-weekly, in conjunction with healthy diet and exercise

The WeCare Difference

Our injections are uniquely formulated in our state-of-the-art sterile compounding facility using only the highest quality components.

Plus, our injection is unique in that it contains **lidocaine**, making the injection virtually painless for patients.
